AMENDMENTS TO THE CLAIMS

- 1 1. (currently amended) A freestanding candle, in an operable position having a wick supported by a fuel body and extending upwardly from a top surface of the fuel body, the
- 3 candle comprising:

4

6

- (a) a flame-resistant sheet joined to the <u>bottom surface of the</u> fuel body in proximity to a lower end of the wick and extending outwardly at least substantially one inch from the longitudinal axis of the wick; and
- (b) an upright wick support <u>attached to contacting</u> the sheet and holding the lower end of the wick, the <u>attached</u> support forming a <u>liquid fuel flow</u> barrier separating the lower end of the wick from the fuel body.
- 2. (cancelled)
- 1 3. (currently amended) The candle of claim 12, wherein the wick support is sealingly bonded 2 to the sheet.
- 4. (original) The candle of claim 3, wherein the sheet has an adhesive backing that bonds to the wick support and the bottom surface of the fuel body.
- 5. (currently amended) The candle of claim 1, wherein the flow barrier is the wick support
- 2 hus a sealant disposed at least across an opening to a bore extending through the wick
- 3 support.
- 1 6. (original) The candle of claim 1, wherein the wick support is formed in situ unitarily with
- 2 the wick.
- 1 7. (original) The candle of claim 6, wherein the wick support is a solid, flame-resistant agent
- 2 disposed on a surface of the lower end of the wick.

- 1 8 (original) The candle of claim 6, wherein the wick support is a solid, flame-resistant agent
- 2 impregnating the lower end of the wick.
- 9. (original) The candle of claim 7 or 8, wherein the wick support is bonded to the sheet by
- 2 the flame-resistant agent.
- 1 10. (original) The candle of claim 1, wherein the wick support is a block of solid, flameresistant material.
 - 11. (original) The candle of claim 1, wherein the wick support extends above the sheet an amount sufficient to prevent a candle fire.
 - 12. (original) The candle of claim 11, wherein the amount sufficient to prevent a candle fire is at least about one-half inch.
- 1: 13. (original) The candle of claim 1, wherein the sheet extends substantially to an outer 2: peripheral surface of the fuel body.
- 1: 14. (original) The candle of claim 1, wherein the sheet has a peripheral rim having a thickness greater than the sheet.
- 1 15. (original) The candle of claim 1, wherein the sheet has a flange at an outer boundary.
- 1 16. (original) The candle of claim 1, wherein the sheet is imbedded within the fuel body.
- 1 17. (original) The candle of claim 1, wherein the sheet is adhered to the bottom surface of the
- 2 fuel body.
- 1 18. (original) The candle of claim 1, wherein the sheet is corrugated.

Page 3 of 12

- 19. (original) The candle of claim 1, wherein the sheet is dome-shaped. 1
- 20. (original) The candle of claim 1, wherein the fuel body has multiple wicks. 1
- 21. (original) The candle of claim 20, wherein each flame-resistant sheet in proximity to each wick extends at least one inch from the longitudinal axis of each wick. 2
 - 22. (original) The candle of claim 1, wherein the wick support is crimped.
 - 23. (original) A method of forming an upright wick support on a wick of a freestanding candle, the method comprising:
 - impregnating in advance an end region of said wick with a flame-resistant (a) scalant; and
 - bonding said end region of said wick to a flame-resistant sheet. (b)
 - 24. (new) A fire hazard reducing improvement to a freestanding candle having a width of at least two inches and a wick supported by a fuel body, the wick, in an operable position of the candle, extending along a longitudinal axis through the fuel body, from near a lower end surface of the fuel body to a top surface of the fuel body from which the wick extends, wherein the improvement comprises:
 - a flame-resistant sheet bonded to the lower surface of the fuel body and extending outwardly from said longitudinal axis at least substantially one inch from the longitudinal axis of the wick.
